Two compounds with similar anion backbone, $[Na_2(H_2O)_{10}(NH_4)_4][V_{10}O_{28}]$ (**1**) and $[Na_2(H_2O)_{10}(NH_4)_4][V_9MoO_{28}]$ (**2**), are described. The anion of **1** is of decavanadate with normal structure, while the anion of **2** has a molybdenum atom mixing with four vanadine atoms at certain positions in the similar backbone of the decanucleus structure. Crystal data for $H_{36}N_4O_{38}Na_2V_{10}$ (**1**): triclinic, space group $P\bar{1}$, $a = 0.86024(4)$ nm, $b = 1.04561(5)$ nm, $c = 1.12828(4)$ nm, $\alpha = 68.833(1)^\circ$, $\beta = 87.158(1)^\circ$, $\gamma = 67.065(1)^\circ$, $V = 0.86665(7)$ nm³, $Z = 1$, $M_r = 1255.71$, $D_c = 2.406$ g · cm⁻³, $F(000) = 620$, $\mu(MoK\alpha) = 2.719$ mm⁻¹. Crystal data for $H_{36}N_4O_{38}Na_2V_9Mo$ (**2**): triclinic, space group $P\bar{1}$, $a = 0.86511(3)$ nm, $b = 1.04549(5)$ nm, $c = 1.12446(5)$ nm, $\alpha = 69.071(1)^\circ$, $\beta = 87.145(1)^\circ$, $\gamma = 66.982(1)^\circ$, $V = 0.86951(6)$ nm³, $Z = 1$, $M_r = 1300.71$, $D_c = 2.484$ g · cm⁻³, $F(000) = 639$, $\mu(MoK\alpha) = 2.802$ mm⁻¹. 0 Introduction

The polyoxometalatic chemistry has a long history, however, they have still attracted much attention from chemists and physicists owing to their varied applications in many fields, such as analytical and clinical chemistry, catalysis, biochemistry, medicine, and solid-state devices^[1]. The polyoxovanadates compose an important part of the polyoxometalates, and of which the decavanadate anion formed normally from acidic aqueous solution is very popular. The structure of the decavanadate anion can be described as that six VO₆ octahedra form a plane with two VO₆ octahedra above and two below the plane via edged-sharing^[2]. According to various protonation degrees, the reported decavanadate polyanions have following types: [V₁₀O₂₈]⁶⁻, [HV₁₀O₂₈]⁵⁻, [H₂V₁₀O₂₈]⁴⁻, [H₃V₁₀O₂₈]³⁻, [H₄V₁₀O₂₈]²⁻, in which only three types polyoxovanadate anions ([V₁₀O₂₈]⁶⁻, [H₂V₁₀O₂₈]⁴⁻, [H₃V₁₀O₂₈]³⁻) seem to be stable in solid state. Many compounds with different cations have been reported, such as Na₆V₁₀O₂₈ · 18H₂O^[3], Ca₃V₁₀O₂₈ · 17H₂O^[4], K₂Zn₂V₁₀O₂₈ · 16H₂O^[5], [(C₅H₅NH)₆(V₁₀O₂₈)]^[2], [(C₆H₇NH)₆(V₁₀O₂₈)]^[2], [(C₅H₅NH)₄(H₂V₁₀O₂₈)]^[2], [(C₇H₉NH)₄(H₂V₁₀O₂₈)]^[2], [(CH₃)₄N]₄[H₂V₁₀O₂₈]^[2], [(C₂H₅)₄N₃][H₃V₁₀O₂₈]^[1c], [(C₆H₇NH)₃][H₃V₁₀O₂₈] · H₂O^[6], [(C₇H₉NH)₃][H₃V₁₀O₂₈] · H₂O^[7], [(n-C₄H₉)₄N]₂[H₄V₁₀O₂₈]^[1c], (NH₄)₄[H₄V₁₀O₂₈][N(CH₂CH₂COOH)₃]₂ · 4H₂O^[8]. Herein we report syntheses and characterizations of two compounds belonging to [V₁₀O₂₈]⁶⁻ family.

1 Experimental

1.1 Syntheses

Compound 1: An aqueous mixture of Na₂MoO₄ · 2H₂O (1.0g, 4.1mmol), NH₄VO₃ (0.2g, 1.7mmol), N₂H₄ · 2HCl (1.9g, 18.1mmol), CH₃COONH₄ (0.6g, 7.8mmol) in 10mL H₂O was heated at 150°C under autogenous pressure for 60h in a sealed 30mL Teflon-linked stainless steel vessel. A solid phase was filtered off, and the filtrate was allowed to stand in open air at ambient temperature. Orange crystals suitable for X-ray diffraction study were isolated after three

days (30% yield based on V). Elemental analysis: Calc. (%) for H₃₆N₄O₃₈Na₂V₁₀, H, 2.89; N, 4.46; O, 48.42; Na, 3.66; V, 40.57. Found(%): H, 2.95; N, 4.50; O, 48.38; Na, 3.69; V, 40.61%.

Compound 2: To a mixture solution of Na₂MoO₄ · 2H₂O (1.4g, 5.8mmol), NH₄VO₃ (0.7g, 6.0mmol), CH₃COONH₄ (1.0g, 13.0mmol) and N₂H₄ · 2HCl (0.2g, 1.9mmol) in 10mL H₂O and 50% acetic acid (5ml, pH (4.20) was added 5mL DMSO and the resultant was allowed to stand in open air at ambient temperature. Dark green crystals of **2** were isolated after a week (70% yield based on V). Elemental analysis: Calc. (%) for H₃₆N₄O₃₈Na₂V₉Mo, H, 2.79; N, 4.31; O, 46.74; Na, 3.53; V, 35.25; Mo, 7.38. Found(%): H, 2.86; N, 4.25; O, 46.80; Na, 3.50; V, 35.21; Mo, 7.42.

1.2 Structure Determination

Two sets of data for **1** and **2** with approximate dimensions of 0.28mm × 0.23mm × 0.21mm for **1** and 0.31mm × 0.26mm × 0.24mm for **2** were collected on a Simens Smart CCD diffractometer equipped with graphite-monochromatized Mo K α radiation ($\lambda = 0.071073$ nm) at room temperature. The structures were solved by direct methods and succeeding difference Fourier syntheses, and then refined by full-matrix least-squares method anisotropically for all metal atoms and coordinative oxygen atoms. All calculations were performed by using SHELXTL-97 program package^[9].

Compound 1: A total of 4521 reflections were collected in the range of $1.95^\circ < \theta < 25.01^\circ$, of which 3030 ($R_{\text{int}} = 0.0193$) were unique ($I > 2\sigma(I)$), the final convergence indices $R = 0.0595$ and $wR = 0.1718$ ($w = 1/\sqrt{\sigma^2(F_o^2) + (0.0800P)^2 + 8.35P}$) where $P = (\max(F_o^2, 0) + 2F_c^2)/3$, $S = 1.097$, and $(\Delta/\sigma)_{\text{max}} = 0.000$. The maximum and minimum residual peaks on the final difference Fourier map are 1126e · nm⁻³ and -1236e · nm⁻³, respectively. CSD: 413132.

Compound 2: A total of 4166 reflections were collected in the range of $1.95^\circ < \theta < 24.00^\circ$, of which 2718 ($R_{\text{int}} = 0.0186$) were unique ($I > 2\sigma(I)$), the final convergence indices $R = 0.0542$ and

$$wR = 0.1964 \quad (w = 1 / [\sigma_2(F_o^2) + (0.1340P)^2 + 8P])$$

where $P = (\max(F_o^2, 0) + 2F_c^2)/3$, $S = 1.005$, and $(\Delta/\sigma)_{\text{max}} = 0.005$. The maximum and minimum residual peaks on the final difference Fourier map are $653e \cdot \text{nm}^{-3}$ and $-1179e \cdot \text{nm}^{-3}$, respectively. CSD: 413133.

The crystal data and experimental details are given in Table 1.

2 Results and Discussion

The X-ray structural analyses of compounds **1** and **2** reveal that both anions of the compounds have the same backbone structures (Fig. 1). The decavanadate anion can be described as ten tetragonal bipyramidal VO_6 are connected via edge-sharing and corner-sharing modes. According to different positions in one of the anion, there are three types of vanadium atoms: (I) four V atoms are located above and below the equatorial

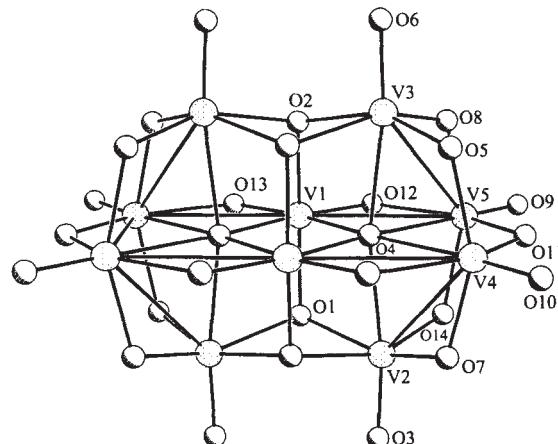

Fig. 1 Ball-and-stick figure of $[\text{V}_{10}\text{O}_{28}]$ anion

plane (V_2 , V_3 and their symmetry equivalent atoms); (II) four V atoms are located on the equatorial plane (V_4 , V_5 and their symmetry equivalent atoms); (III) two central vanadium atoms are on the equatorial plane (V_1 and its symmetry atom). Similarly,

according to the coordinative conditions, the oxygen atoms in each anion can be classified: (I) eight terminal O, with V-O distances of 0.1613~0.1653 nm; (II) fourteen μ_2 -O (V-O: 0.1688~0.2102 nm); (III) four μ_3 -O (V-O: 0.1924~0.2093 nm); (IV) two μ_6 -O (V-O: 0.2121~0.2374 nm). Tables 2 and 3 list the selective bond lengths and bond angles of **1** and **2**, respectively.

By means of the empirical bond length/bond number calculation[10], $s = (R/1.79)^{-5.1}$ ($R = \text{V-O}$ distance; $s = \text{bond number}$), the protonation sites were also confirmed. Tables 4 and 5 list the bond numbers

for selective oxygen atoms of **1** and **2**, respectively, which reveal that none of oxygen atoms is protonated and both anions of the backbones belong to $[\text{V}_{10}\text{O}_{28}]^{6-}$ type.

According to structural analysis, there is a Mo atom to occupy one of four positions (V_2 , V_3 and their symmetry equivalents) in anion of **2** randomly, which was confirmed by atomic absorption analysis and the different colour appearance of **2** from **1**, although **2** has the same unit cell parameters with **1**. There are eight lines appearing in the EPR of **2** which indicates that four valence V atom must exist (Fig. 2), and the dark

Symmetry transformations used to generate equivalent atoms: #1: -x+1, -y+2, -z+1.

* V(2) and V(3) may be randomly replaced by Mo.

Table 4 Bond Valence Calculation of Selective O Atoms of Compound 1

atom	$\sum s_i$	atom	$\sum s_i$	atom	$\sum s_i$
$\mu_2\text{-}04$	1.6998	$\mu_2\text{-}08$	1.6776	$\mu_2\text{-}011$	1.8124
$\mu_2\text{-}05$	1.6352	$\mu_2\text{-}09$	1.6599	$\mu_3\text{-}012$	1.7390
$\mu_2\text{-}06$	1.7338	$\mu_2\text{-}010$	1.7933	$\mu_3\text{-}013$	1.7598

Table 5 Bond Valence Calculation of Selective O Atoms of Compound 2

atom	$\sum s_i$	atom	$\sum s_i$	atom	$\sum s_i$
$\mu_2\text{-}05$	1.6087	$\mu_2\text{-}011$	1.7502	$\mu_2\text{-}014$	1.6963
$\mu_2\text{-}07$	1.6263	$\mu_2\text{-}012$	1.8072	$\mu_3\text{-}01$	1.7094
$\mu_2\text{-}08$	1.6992	$\mu_2\text{-}013$	1.7998	$\mu_3\text{-}02$	1.7021

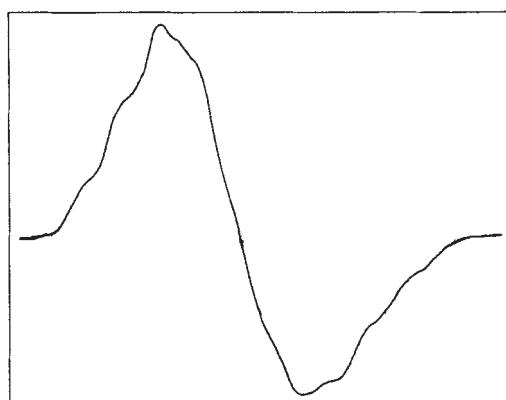

Fig. 2 EPR spectrum graphic of compound 2

green color of **2** is agreeable to the V^{IV} existence. The results of the empirical bond length/bond number calculation (the bond number valence of V(5) is about 4.5) indicates one electron is reduced in the deavanadate anion of **2**. Based on the above analyses, the anion of **2** is formulated as [Mo^{VI}V^{IV}V₈^VO₂₈].
