

苯基乙酰甲基亚砜与碱土金属配合物的合成和晶体结构

李文先* 王宏胜 胡瑞珏 其其格
(内蒙古大学化学化工学院, 呼和浩特 010021)

摘要: 本文选取苯基乙酰甲基亚砜($C_6H_5SOCH_2COCH_3$)作为配体与碱土金属(钙、锶)的高氯酸盐反应得到配合物的单晶, 对它们进行了元素分析及红外光谱表征, 它们的化学式为 $[ML_6](ClO_4)_2$ (M=Ca、Sr; L= $C_6H_5SOCH_2COCH_3$)。并用 X-ray 单晶衍射法测定了钙、锶配合物的晶体结构。

关键词: 碱土金属; X-ray 晶体结构; 苯基乙酰甲基亚砜

Synthesis and Crystal Structure of Phenyl-acetyl Methylene Sulfoxide Complexes with Alkaline-Earth Metal

LI Wen-Xian* WANG Hong-Shneg HU Rui-Jue QI Qi-Ge

(College of Chemistry & chemical Engineering, Inner Mongolia University, Huhhot 010021)

Abstract: Two complexes of alkaline-earth metals perchlorate with phenyl-acetyl methylene sulfoxide($C_6H_5SOCH_2COCH_3$) have been synthesized and characterized by elemental analysis and IR spectra. Composition of complexes are $[ML_6](ClO_4)_2$ (M=Ca, Sr; L= $C_6H_5SOCH_2COCH_3$). The crystal structures of the complexes of Ca and Sr were determined by X-ray single crystal diffraction analysis. CCDC: 23880 (Ca); 23881 (Sr).

Key words: alkaline-earth metals; X-ray crystal structure; phenyl-acetyl methylene sulfoxide

Sulfoxide as a kind of organic ligand has been numerously studied in Rare Earth Coordination Chemistry^[1-3]. Alkaline metals have the similar properties as Rare Earth. In recent years, many studies focus on Alkaline-Earth metals^[4-6]. In addition, some complexes of Alkaline-Earth metals can possibly be used as precursor of metal organic chemical vapour deposition (MOCVD)^[7,8]. In this paper phenyl-acetyl methylene sulfoxide as ligand reacted with Ca, Sr and Ba perchlorate, to obtain three complexes and single crystals of Ca and Sr complexes.

1 Experimental

1.1 Synthesis of ligand (L)

Sulfide($C_6H_5SCH_2COCH_3$) was synthesized accord-

ing to the methods of ref^[8,9]. Then oxidize the sulfide with H_2O_2 (30%) in acetone at room temperature, yellow oil was obtained, evaporate solvent and recrystallize yellow residue from alcohol, the colorless crystal was obtained(yield about 60%), m.p. 34~35 °C, Anal. Calc. for sulfoxide ($C_6H_5SOCH_2COCH_3$)(%): C, 59.31; H, 5.53. Found(%): C: 59.63; H, 5.31. Elemental analysis data of C, H were determined by PE-2400 elemental analyzer. IR using a KBr pellet was recorded on a Nicolet NEXUS 670 FTIR Spectrophotometer in the 4 000~400 cm^{-1} range.

1.2 Synthesis of complexes

To an alcohol solution (5 mL) of sulfoxide (3 mmol), $M(ClO_4)_2$ (0.5 mmol, M=Ca, Sr) in alcohol was slowly added under stirring. The resulting solution was

filtered and the white residue obtained (complex); the filtrate was allowed to stand in refrigerator, after a week, well-shaped colorless single crystals were obtained from the filtrate of Ca and Sr complexes.

1.3 Single crystal X-ray diffraction

Diffraction experiments of colorless crystals with dimensions $0.26 \text{ mm} \times 0.22 \text{ mm} \times 0.18 \text{ mm}$ for Ca complex and $0.22 \text{ mm} \times 0.18 \text{ mm} \times 0.14 \text{ mm}$ for Sr were performed with graphite-monochromated Mo $K\alpha$ radiation ($\lambda=0.071073 \text{ nm}$) on a Bruker SMART 1000 CCD diffractometer at 293 K, 2 178 (Ca) and 2 231

(Sr) data were collected.

Data collection and reduction were performed using the SMART and SAINT software with frames of 0.3° oscillation in the θ ranges of $1.87^\circ < \theta < 26.34^\circ$ (Ca) and $1.86^\circ < \theta < 26.51^\circ$ (Sr). The structures were solved by direct methods and refined by full-matrix least squares based on F^2 using the SHELXTL program package. Summaries of crystallographic data and additional data collection parameters for the two complexes were given in Table 1.

CCDC: 23880 (Ca); 23881 (Sr).

2 Results and discussion

2.1 Composition of complexes

Elemental analysis data of three complexes were determined by PE-2400 elemental analyzer. The results is in Table 2.

Table 2 Composition analysis of complexes (%)

Complexes	C	H
$[\text{CaL}_6](\text{ClO}_4)_2$	48.39(48.68)	4.41(4.54)
$[\text{SrL}_6](\text{ClO}_4)_2$	46.89(47.00)	4.29(4.38)
$[\text{BaL}_6](\text{ClO}_4)_2$	45.62(45.36)	4.08(4.23)

2.2 Description of crystal structure

Fig.1 and Fig.2 show the crystal structure of the complexes of Ca and Sr, Fig.3 and Fig.4 are their structure of cell respectively. X-ray diffraction crystal structure analyses reveal that the two complexes are similar in their molecule structure. Each unit consists of one M^{2+} ($M=Ca, Sr$) and six neutral sulfoxides(L). C. N. of M^{2+} is six and M^{2+} coordinated with sulfoxides by the oxygen atom in sulfinyl group while the oxygen atom in carbonyl group did not bond with M^{2+} . The distance of Ca-O is at the range of 0.231 49(18)~0.231 50(18) nm and Sr-O is all 0.245 36(18) nm; the bond angles of O-Ca-O and O-Sr-O are all close to 90° or 180°. Table 3 and Table 4 gives the selected

Fig.2 Crystal structure of $[\text{SrL}_6]^{2+}$ Fig.3 Packing of $[\text{CaL}_6](\text{ClO}_4)_2$

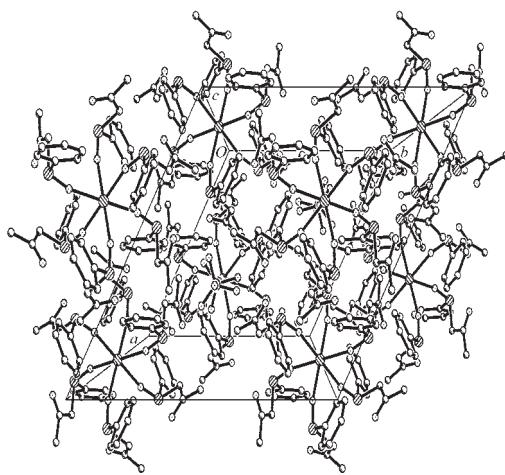

Fig. 4 Packing of $[\text{SrL}_6](\text{ClO}_4)_2$

bond lengths and bond angles of the Ca and Sr complexes respectively.

All the hydrogen atoms were omitted in Fig.1 and Fig.2 for clarity.

2.3 IR spectrum

Compare the IR spectrum of sulfoxide with their complexes, some conclusions can be obtained: In the ligand IR spectrum, there are two very strong peaks, the one at $1\ 041\ \text{cm}^{-1}$ ascribed to the S=O group stretching and the other at $1\ 709\ \text{cm}^{-1}$ to C=O group. In the complexes IR spectra, the S=O groups stretching are at $1\ 046\ \text{cm}^{-1}$ (Ca), $1\ 038\ \text{cm}^{-1}$ (Sr) and $1\ 026\ \text{cm}^{-1}$ (Ba); the C=O groups are at $1\ 716\ \text{cm}^{-1}$ (Ca), $1\ 715\ \text{cm}^{-1}$ (Sr) and $1\ 714\ \text{cm}^{-1}$ (Ba) respectively. In addition,

there are two additional peaks at $1\ 089\ \text{cm}^{-1}$ and $623\ \text{cm}^{-1}$, which are attributed to ClO_4^- group.

3 Conclusion

In the three complexes, each M^{2+} ($\text{M}=\text{Ca}, \text{Sr}, \text{Ba}$) coordinated with six ligands by oxygen atom in sulfinyl group. The molecule structure of Ca and Sr complexes is approximately an octahedron. The two ClO_4^- anions did not coordinate with M^{2+} .
